

[API 참고서 >](#)

Static React DOM APIs

The `react-dom/static` APIs let you generate static HTML for React components. They have limited functionality compared to the streaming APIs. A [framework](#) may call them for you. Most of your components don't need to import or use them.

Static APIs for Web Streams

다음 메서드들은 브라우저, Deno, 및 일부 최신 엣지 런타임을 포함하는 [Web Streams](#) 환경에서만 사용할 수 있습니다.

- `prerender` renders a React tree to static HTML with a [Readable Web Stream](#).
- ⚠ Experimental only `resumeAndPrerender` continues a prerendered React tree to static HTML with a [Readable Web Stream](#).

Node.js also includes these methods for compatibility, but they are not recommended due to worse performance. Use the [dedicated Node.js APIs](#) instead.

Static APIs for Node.js Streams

다음 메서드들은 [Node.js Streams](#) 환경에서만 사용할 수 있습니다.

- `prerenderToNodeStream` renders a React tree to static HTML with a [Node.js Stream](#).
- ⚠ Experimental only `resumeAndPrerenderToNodeStream` continues a prerendered React tree to static HTML with a [Node.js Stream](#).
